Technology Summary
This technology is a documentation tool used by chaplains allowing intervention and spiritual assessment for patients and their families. The tool is quick and easy-to-use by designing the flow of documentation as a step-wise process and storing data into an electronic medical record to access in the future. The tool is flexible to both spiritual interventionists and counselors, allowing both prepopulated and narrative components. This flexibility allows users with different levels of experience to easily implement this tool into their practice. Components of the spiritual assessment tool allow for a more detailed description rather than limiting beliefs to a single religion.

Technology Status
Prototype developed, Copyright protected
This technology is available for licensing to industry for further development and commercialization.

Applications
- Documentation tool for spirituality assessment
- Electronic Medical Records tool for counsellors

Advantages
- Easy to implement into daily practice
- Time efficient
- Focuses on spiritual assessment
- Documents intervention and assessment
